InterMotive To Launch An Idle Bypass Device

Colfax, CA (*April 1, 2009*) InterMotive has launched the sale of a PTO idle controller (PIC) that allows the engine to remain "On" beyond the anti-idle timer limit (because of a PTO command) with the RPM set at a low speed (e.g. 675 rpm).

One example is the operation of a clutch pump. In current applications, a clutch pump does not require the PTO to be activated. This means the engine would shut "Off" after only a few minutes of operation. The PIC addresses this issue.

InterMotive is an ISO 9001:2000 registered company based out of Colfax, California that designs and manufactures vehicle control systems for the transit, school bus, personal-use, emergency response, and work truck markets. To learn more about InterMotive's products, call 800-969-6080 or visit their website at www.intermotive.net.
